

This site features predictions of future technology based upon current emerging tech and inventions plus trends. Emerging tech is exciting in and of itself, but it is nothing compared to future technology 5, 10, 50 and 100 years from now.

One can only envision the future technology that our kids and grandkids will be able to use on a daily basis. Future technology will allow the generation of today to live longer due to advances in medicine, use more high tech computers and electronics than we can now imagine, and drive future cars with no emissions and zero carbon footprints.

Not only that but our grandchildren will take advantage of future energy, smart homes and cars, robots and bionics to serve them and make life easier. Future weapons will actually be smarter, more precise and reduce the need for machismo among countries and will encourage non-proliferation.

Future space technology will bring spacecraft to the far reaches of this solar system and beyond. Space tourists will actually get to fly to Mars as in the movie Total Recall. Future education technology will mean students will learn faster, retain information longer, process information and retain memory like we can now not even imagine.

Future electronics will go way beyond the iPad using holograms and other virtual reality technology. What once was believed to be science fiction will simply be known as science. Future robotic surgery will mean more precision, less complication and faster healing. Medical databases will interact at light speed to give the utmost in patient care for disease and injuries.
